

1 Montana Public Service Commission
2 Docket No. 2022.07.078
3 Electric and Natural Gas General Rate Review
4
5
6

7 PRE-FILED DIRECT TESTIMONY
8 OF THOMAS D. PANKRATZ
9 ON BEHALF OF NORTHWESTERN ENERGY
10

11 TABLE OF CONTENTS

12 <u>Description</u>	<u>Starting Page No.</u>
13 Witness Information	2
14 Purpose of Testimony	2
15 Electric Transmission System Planning	3
16 Electric Transmission System Costs	6
17	
18 <u>Exhibits</u>	
19 2020-2021 Regional Transmission Plan	Exhibit TDP-1
20 2020-2021 Local Area Plan	Exhibit TDP-2

21

1 **Witness Information**

2 **Q. Please provide your name, employer, and title.**

3 **A.** My name is Thomas D. Pankratz. I am NorthWestern Energy's
4 ("NorthWestern") Director of Electric Transmission Engineering and
5 Project Management.

6
7 **Q. Please provide a description of your relevant employment
8 experience and other professional qualifications.**

9 **A.** I have been in my current position with NorthWestern since 2017. In this
10 position, I am responsible for electric transmission planning, transmission
11 line engineering, and major project management. I have worked in the
12 utility industry for 28 years – first in the engineering consulting field and
13 the last 23 years for NorthWestern leading to my present position. My
14 relevant experience is in electric transmission engineering, project
15 management, system planning, and capital portfolio management. I am a
16 licensed Professional Engineer (PE) in Montana and a certified Project
17 Management Professional (PMP).

18
19 **Purpose of Testimony**

20 **Q. What is the purpose of your testimony in this docket?**

21 **A.** I describe NorthWestern's electric transmission system planning and
22 electric transmission system costs since our 2018 electric general rate

1 review (2017 test year) before the Montana Public Service Commission
2 (“Commission”).

3

4 **Electric Transmission System Planning**

5 **Q. Please describe the transmission infrastructure that is necessary to**
6 **provide customers with reliable service.**

7 **A.** Transmission facilities carry bulk power over longer distances from
8 generation facilities to cities and communities or across state lines and
9 regions where it is needed. They carry bulk power to local substations
10 where the voltage is converted or ‘stepped-down’ to lower distribution
11 voltages and facilities to serve residential and commercial customers.
12 Large industrial customers such as the refineries in Billings and Great
13 Falls receive their power at the transmission level voltage.

14

15 **Q. Please provide an overview of NorthWestern’s electric transmission**
16 **system planning.**

17 **A.** NorthWestern’s transmission planning processes ensure the transmission
18 system can operate reliably and safely to meet our customers’ expected
19 load forecasts now and into the future. NorthWestern engages in both
20 local and regional planning to ensure the transmission system is well
21 maintained and improved in order to continue to provide customers with
22 safe and reliable service.

23

1 For regional planning, NorthWestern participates in the planning
2 organization for the Pacific Northwest known as NorthernGrid.
3 NorthernGrid uses power flow contingency analysis to assess which
4 projects could best meet system reliability performance requirements and
5 transmission needs for a 10-year planning period. This analysis applies to
6 the NorthernGrid footprint, which primarily includes the states of
7 Washington, Oregon, Idaho, Montana, Wyoming, Nevada, and Utah. The
8 2020-2021 Regional Transmission Plan is attached as Exhibit TDP-1.
9 This plan satisfies Federal Energy Regulatory Commission (FERC) Order
10 No. 1000 requirements for each region to produce a plan.

11
12 For local planning, NorthWestern develops a Local Area Plan every two
13 years for 5-, 10-, and 15-year planning horizons. The 2020-2021 Local
14 Area Plan is attached as Exhibit TDP-2. As explained in NorthWestern's
15 Local Area Plan, after the completion of system studies, NorthWestern
16 prioritizes system issues. Table 1 below depicts NorthWestern's
17 consideration of issues based on potential consequences and likelihood of
18 an event and the associated issue with the four key policy drivers behind
19 investments: (1) Asset Life, (2) Reliability, (3) Compliance, and (4)
20 Capacity, as discussed in the Pre-filed Direct Testimony of Michael R.
21 Cashell.

22

Table 1

Strategic Alignment	Asset Life = proactive (asset condition and performance)	Reliability = reactive (impact to system deliverability if failure occurs)	Compliance = risk (consequence and probability)	Capacity = system availability (current availability and projected growth)
Company Approved Performance Target	Asset age compared to useful life	Business function or customer impacted	Level of compliance	Current system demand
System impacts if event occurs	Asset's current condition (health)	System impacts	System condition (conditions that must exist to create consequence)	System Improvements
History of the asset	History of performance	Historical level of service	Probability of event (frequency)	How often are systems currently overloaded
Operational Issues	Operation and Maintenance Costs	Operational impacts	Safety	Projected Growth

1 **Q. Please describe the four key policy drivers in Table 1.**

2 **A.** The Asset Life category includes costs for investment in existing
 3 infrastructure to maintain those assets that are near the end of their useful
 4 life and replacements of transmission assets such as structures, poles,
 5 lines, substation equipment, and related equipment.

6
 7 The Reliability category includes investment in infrastructure and related
 8 improvements focused on maintaining or improving reliability of the
 9 transmission system.

10

1 The Compliance category includes projects focused on maintaining
2 compliance with laws and regulations such as North American Electric
3 Reliability Corporation (“NERC”) and Western Electricity Coordinating
4 Council (WECC) requirements.

5
6 The Capacity category focuses on the demands on the current availability
7 of the system and investments for maintaining or improving transmission
8 capacity.

9

10 **Electric Transmission System Costs**

11 **Q. Do all of NorthWestern’s transmission system costs fall into the four**
12 **key policy drivers in Table 1?**

13 **A.** For the most part, yes. NorthWestern uses the Table 1 scoring matrix to
14 score and rank the majority of its planned capital investments but not all.
15 Some system costs such as reactive storm repair, interconnection-related
16 costs, and costs associated with the Colstrip Transmission System are not
17 part of the scoring matrix.

18

19 **Q. Are NorthWestern’s transmission system costs increasing?**

20 **A.** Yes. NorthWestern’s investment in the electric transmission system has
21 continued to grow year over year from approximately \$53 million in 2018
22 to approximately \$76 million in 2021. This represents an increase of
23 approximately 43%, and an average annual increase of approximately

1 10.7%. This includes significant investment in Asset Life projects such as
2 transmission pole replacements on the nearly 7,000 miles of the electric
3 transmission system and Capacity & Reliability improvement projects
4 directed at increasing or improving transmission capacity and reliability for
5 our customers.

6
7 For example, in this time period, NorthWestern's costs included
8 approximately \$31 million in the Helena area transmission system to
9 rebuild the 1915-era 100-kilovolt ("kV") transmission line from Holter to
10 Helena and to construct the new Lake Helena Switchyard and the new
11 Custer Avenue Substation. At the same time, NorthWestern's costs also
12 included approximately \$13 million in upgrading transformer capacity in
13 the Butte area and approximately \$7 million rebuilding the 69kV
14 transmission line from Livingston to Emigrant. These are examples of
15 projects aimed at improving capacity and reliability of the transmission
16 system to serve our customers.

17

18 **Q. Please describe the significant projects associated with the Asset**
19 **Life category.**

20 **A.** Asset life projects include investments and replacement of existing assets
21 such as transmission poles and switches along with substation breakers
22 and other equipment that is at the end of its useful life or approaching
23 obsolescence. For example, wood transmission poles have a life

1 expectancy of 60 years. NorthWestern invests in and maintains each
2 wood pole to maximize life expectancy and reliable performance by testing
3 and treating them at certain prescribed intervals. If tests reveal those
4 poles no longer meet program metrics or reliability expectations,
5 NorthWestern replaces them as part of its system integrity program.
6 NorthWestern's electric transmission system consists of nearly 7,000
7 miles of transmission lines, and the average age of the current wood pole
8 plant is 45 years. Similarly, aging substation equipment replacement is
9 part of the Asset Life cost category. NorthWestern's pole replacement
10 costs alone continue to grow year over year from approximately \$13.8
11 million in 2018, \$16.2 million in 2019, \$20.5 million in 2020, and \$26
12 million in 2021. This growing investment represents costs associated with
13 maintaining critical aging facilities and equipment.

14

15 **Q. Please describe the significant projects associated with the**
16 **Reliability category.**

17 **A.** Reliability improvement projects include costs to improve system
18 performance and reduce system and customer impacts due to poor
19 performing assets. Example costs since 2018 include the aforementioned
20 Livingston to Emigrant 69kV rebuild, segmentation projects, and other
21 transmission circuit projects designed to modernize and improve system
22 performance when the asset facility is not meeting reliability expectations.
23 Example segmentation and circuit projects since 2018 include upgrades to

1 the Havre to Chester 69kV transmission lines, upgrades to the 50kV and
2 100kV Roundup area transmission lines and the relocation of 161kV
3 transmission lines in Missoula due to river flooding.

4

5 **Q. Please describe the significant projects associated with the**
6 **Compliance category.**

7 **A.** NorthWestern's costs from 2018 to 2021 on compliance-related projects
8 were over \$35 million. These costs were primarily associated with a
9 NERC Facilities Alert requirement that required NorthWestern to review
10 and comply with NERC requirements for transmission line facility ratings.
11 As part of that effort, NorthWestern was required to rebuild and improve
12 ground clearance to meet power rating capacities on certain transmission
13 lines. These projects ensured the transmission lines could be operated at
14 required capacities and in compliance with National Electric Safety Code
15 (NESC) ground clearance requirements.

16

17 **Q. Please describe the significant projects associated with the Capacity**
18 **category.**

19 **A.** Capacity limitations are continuing to grow in certain parts of the electric
20 transmission system due to customer growth in Montana and use of the
21 transmission system. The Bozeman area, the greater Billings area, and
22 the Bitterroot Valley are examples of high growth areas where
23 NorthWestern has identified the need for significant capacity

1 improvements on the transmission system. NorthWestern invested
2 approximately \$65 million from 2018 to 2021 on capacity-related projects.
3 Example Capacity investments since 2018 include the aforementioned
4 upgrades in the Helena and Butte areas, upgrades to transformer capacity
5 at East Gallatin Substation near Bozeman, transmission rebuilds in Big
6 Sky, transmission upgrades in Billings, and new reactive devices at
7 Wilsall.

8

9 **Q. Does this conclude your testimony?**

10 **A.** Yes, it does.

VERIFICATION

This Pre-filed Direct Testimony of Thomas D. Pankratz is true and accurate to the best of my knowledge, information, and belief.

/s/ Thomas D. Pankratz
