

7 PRE-FILED DIRECT TESTIMONY  
8 OF KEITH W. MEAGOR  
9 ON BEHALF OF NORTHWESTERN ENERGY  
10

11 TABLE OF CONTENTS

12 <u>Description</u>	<u>Starting Page No.</u>
13 Witness Information	1
14 Purpose and Summary of Testimony	3
15 Natural Gas Transmission Investments - PHMSA	4

16  
17  
18 Witness Information

19 **Q. Please provide your name, employer, and title.**

20 **A.** My name is Keith W. Meagor. I am NorthWestern Energy's  
21 ("NorthWestern") Manager of Gas Transmission Compliance and System  
22 Integrity.

23  
24 **Q. Please provide a description of your relevant employment**  
25 **experience and other professional qualifications.**

1 **A.** I have worked for NorthWestern for 17 years and with Gas Transmission  
2 and Storage (“GTS”) for the last 9 years. I am a registered Professional  
3 Engineer in the States of Montana, South Dakota, and Nebraska. I am a  
4 graduate of Montana Tech with a Bachelor of Science degree in General  
5 Engineering with Mechanical and Welding emphasis. I also completed  
6 two years of Master’s Program courses at Montana Tech in Physical  
7 Metallurgy.

8  
9 I have been working in the area of pipeline safety and specifically with the  
10 Pipeline Hazardous Materials Safety Administration (“PHMSA”) Code of  
11 Federal Regulations (“CFR”), 49 CFR § 191 and 49 CFR § 192 since  
12 2008. Prior to joining GTS, I was the Department of Transportation  
13 (“DOT”) Coordinator for Distribution’s Asset Management & Organizational  
14 Performance Groups at NorthWestern from 2008 to 2013. In that role, I  
15 oversaw all Montana Gas Distributions System (GDS) compliance and  
16 integrity, including being a lead in the development of the Distribution  
17 Integrity Management Plan and Distribution System Infrastructure  
18 Program (DSIP).

19  
20 In October of 2013, I joined GTS as Gas Transmission Infrastructure  
21 Program Engineer. In that role, I continued to work under 49 CFR § 191  
22 and 49 CFR § 192 while I was developing plans to evaluate and assess  
23 the integrity of the transmission system that fell outside the pipeline

1 integrity management criteria. At the end of 2017, because of retirements,  
2 I took over compliance oversight for GTS. This role was similar to the  
3 previous compliance role, but was focused on GTS requirements, such as,  
4 Pipeline Integrity Management, Control Room Management (“CRM”),  
5 Underground Natural Gas Storage Integrity Management, Operator  
6 Qualification (“OQ”), Maximum Allowable Operating Pressure Verification,  
7 Pipeline Safety Management System and more recently, the PHMSA  
8 Mega-Rule changes.

9

10 In 2020, I became the Manager of Gas Transmission Compliance and  
11 then, in 2021, I became the Manager of Gas Transmission Compliance  
12 and System Integrity.

13

14

**Purpose and Summary of Testimony**

15

**Q. What is the purpose of your testimony in this docket?**

16

**A.** My testimony provides details to support NorthWestern’s GTS initiatives  
17 related to pipeline compliance and system integrity. My testimony also  
18 provides the investments and associated costs that NorthWestern has  
19 made in both of these areas and what is anticipated in the near future for  
20 these areas.

21

22

**Q. Please summarize your testimony.**

1 **A.** Pipeline safety investment is critical. Over the last ten-plus years, PHMSA  
2 has substantially increased the number of regulations impacting pipelines,  
3 and now natural gas storage facilities and gathering lines. This, in turn,  
4 has increased NorthWestern’s compliance obligations and associated  
5 work with PHMSA obligations. While capital investment in this area has  
6 been relatively low, it is expected to substantially increase over the next  
7 several years as more regulations become effective.

8

9 **Natural Gas Transmission Investments – PHMSA**

10 **Q. What is PHMSA?**

11 **A.** PHMSA is a federal agency that resides within the DOT. PHMSA is  
12 tasked with ensuring that transportation of hazardous materials is done  
13 safely, and this includes transportation of natural gas. In 2018, Congress  
14 also assigned oversight of natural gas storage facilities to PHMSA.  
15 PHMSA is responsible for developing the regulations that operators are  
16 required to follow to ensure safe and reliable operation of pipelines.  
17 PHMSA also inspects and enforces the regulations, but in the case of  
18 intrastate pipelines (those that do not cross state lines), the state can  
19 enter an agreement with PHMSA and take over the inspection and  
20 enforcement of the regulations, which Montana has done.

21

22

1 **Q. How does PHMSA impact NorthWestern?**

2 **A.** PHMSA impacts NorthWestern through development of pipeline  
3 regulations, bulletins, and inspections that NorthWestern must review and,  
4 most importantly, comply with. Compliance with PHMSA regulations and  
5 bulletins requires NorthWestern to incur substantial costs as described  
6 later in my testimony.

7  
8 **Q. Why is pipeline safety important?**

9 **A.** Pipeline safety, to me, is a culmination of several things. It encompasses  
10 how operators design, construct, inspect, maintain, and protect their  
11 pipelines. It seems simple, but each of those words have extremely big  
12 expectations and requirements. If not done properly, it impacts the safety  
13 of the environment and people who work, live, and play around the  
14 pipelines and storage facilities. Pipeline safety is important because it  
15 ensures safe, reliable, efficient, and environmentally conscious natural gas  
16 service for NorthWestern customers.

17  
18 **Q. What is Transmission Pipeline Integrity Management (“PIM”)?**

19 **A.** PIM is a prescriptive part of 49 CFR § 192 that is used to ensure the  
20 integrity of pipelines through several tasks completed periodically. These  
21 tasks ensure that the pipeline is not damaged, does not have defects, and  
22 that the integrity of the pipeline is suitable for the pipeline to continue to  
23 operate safely. PIM focuses mainly on the locations where the population

1 density meets a certain level within a defined area around the pipeline.  
2 When those two criteria (location and density) are met, it creates a High  
3 Consequence Area (“HCA”). PIM requires continual assessment of HCAs  
4 as well as continuing to monitor for new HCAs. A PIM plan also requires  
5 operators to take information learned from the system (in HCAs or not)  
6 and apply that information across the system to like areas, conditions, or  
7 materials.

8

9 **Q. Please describe how PHMSA impacts NorthWestern’s storage**  
10 **facilities.**

11 **A.** The effect PHMSA has on storage facilities is relatively new. As noted  
12 earlier, in 2018, Congress granted PHMSA the ability to develop  
13 regulations that addressed storage fields. PHMSA issued an interim final  
14 rule for storage fields, which incorporated recommended practices from  
15 the American Petroleum Institute into 49 CFR § 192.<sup>1</sup> This, in turn,  
16 caused operators to react quickly and develop Underground Natural Gas  
17 Storage Integrity Management Programs or, as NorthWestern calls them,  
18 UGSIM. This interim rule applied the integrity management principles that  
19 I described above to storage fields, which included storage wells and  
20 reservoirs. In 2020, the interim rule was issued as a final rule and codified  
21 into 49 CFR § 192. PHMSA impacts storage fields and facilities in a very

---

<sup>1</sup> Specifically, Recommended Practices 1170 and 1171 were incorporated by reference in 49 CFR § 192.

1 similar manner as it does with pipelines – through the issuance of  
2 regulations, bulletins, and inspections.

3  
4 **Q. Does the Montana Public Service Commission (“Commission”) play**  
5 **any role in PHMSA-related matters with Gas Transmission and**  
6 **Storage?**

7 **A.** Yes. The Commission plays a large role in PHMSA-related matters. As I  
8 noted earlier, for intrastate facilities that are regulated under 49 CFR §  
9 192, PHMSA has entered into agreements with states. The states can  
10 determine what groups within the state are responsible for this  
11 implementation – in some cases, it is Fire Marshals, and in most cases, it  
12 is implemented by state public service commissions or public utility  
13 commissions that develop a pipeline safety office. That office is then  
14 responsible for inspection and enforcement. States cannot implement  
15 standards that set forth lesser requirements than those found in the CFR,  
16 but they can make them more stringent. Additionally, the Commission  
17 gets directly involved if there are issues with non-compliance, poor  
18 performance, or conforming to the regulations. It decides whether  
19 penalties should be levied against operators for non-compliance. In 2021,  
20 the Commission’s Pipeline Safety Office entered into an agreement with  
21 PHMSA to also take over inspection and enforcement of the intrastate  
22 storage fields. PHMSA and the Commission share joint enforcement of 49  
23 CFR § 191, which contains the reporting requirements. This part of code

1 is what requires operators to submit annual reports, safety-related  
2 conditions, incident reports, and notifications for certain work.

3

4 **Q. What process does NorthWestern Gas Transmission and Storage  
5 utilize to ensure it is compliant with PHMSA obligations?**

6 **A.** In 2020, NorthWestern GTS underwent a restructuring. This restructuring  
7 was aimed at compliance activities. While GTS was compliant in the past,  
8 due to the number of regulations that were expected, including some  
9 substantial new regulations, NorthWestern determined it was necessary to  
10 implement a change to ensure that GTS remained aware of and compliant  
11 with the rules and developed plans as required by the rules. This group is  
12 responsible for monitoring compliance activities and ensuring work related  
13 to regulatory compliance is completed.

14

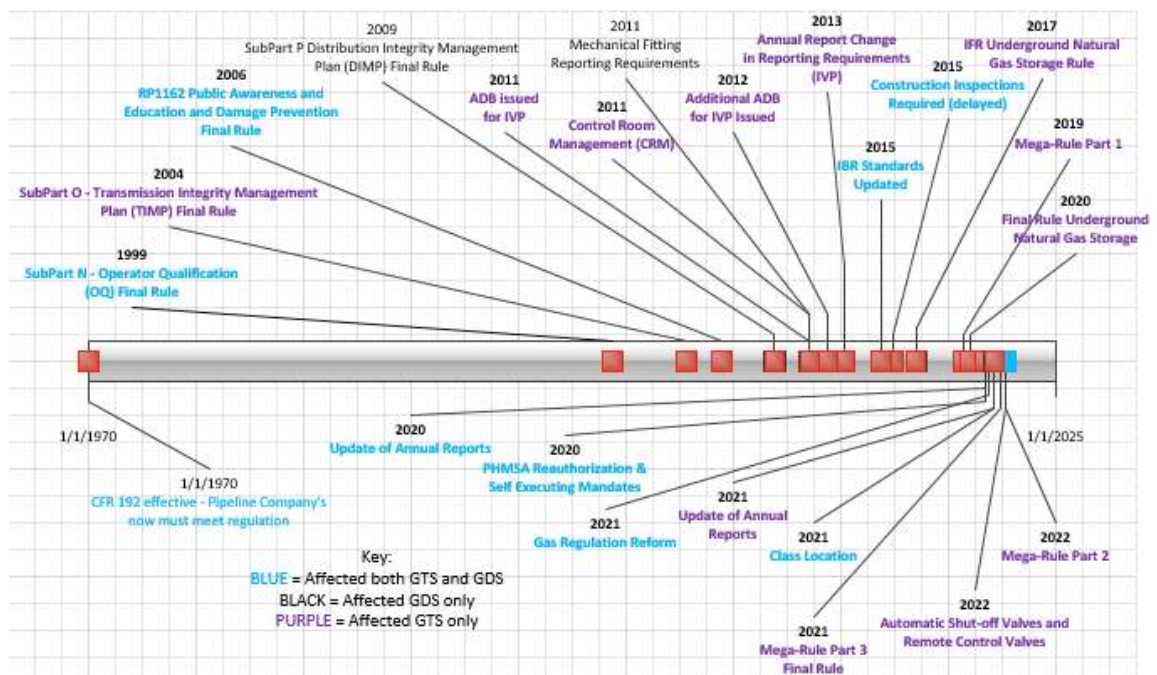

15 **Q. Please identify the substantial regulations you referred to in your  
16 prior answer.**

17 **A.** The regulations I identified as substantial are found in Part 1 of the Mega-  
18 Rule. This rulemaking was called the Mega-Rule because it was the  
19 largest rulemaking since the promulgation of PHMSA-related code in 1970  
20 and it was entirely directed at transmission operators. Adding to the need  
21 to restructure NorthWestern's GTS department was the impending release  
22 of Parts 2 and 3 of the Mega-Rule, the new storage integrity management  
23 requirements, the existing control room management, operator

1 qualification, transmission integrity management program, and other  
 2 existing code requirements with an additional level of focus on  
 3 compliance. In Chart 1 below, I set forth the history of the PHMSA  
 4 regulations, which helps show the magnitude of them in the last ten or so  
 5 years and NorthWestern’s need to restructure with a key focus on  
 6 compliance.

**Chart 1: History of PHMSA Regulations**

7 **Q. What PHMSA-related compliance obligations currently affect**  
 8 **NorthWestern’s Gas Transmission and Storage Department?**

9 **A.** A substantial number of compliance obligations affect NorthWestern’s  
 10 GTS Department, including ones dating back to the 1970s up to recently  
 11 issued rules. In general, there is an operations and maintenance (“O&M”)  
 12 standard or plan/program document for all requirements that cause a

1 compliance obligation by GTS. In all, there are 143 O&M standards, a OQ  
2 Plan, a CRM Plan, a PIM plan, and a UGSIM plan that are all utilized to  
3 comply with the regulatory obligations that affect GTS.

4  
5 The biggest immediate impacts to NorthWestern's GTS Department are  
6 from three main rule changes – Maximum Allowable Operating Pressure  
7 Verification ("MAOPV"), Maximum Allowable Operating Pressure  
8 Reconfirmation ("MAOPR"), and assessment of pipelines outside HCAs.

9  
10 **Q. Please explain the MAOPV rule.**

11 **A.** MAOPV affects GTS because of the need to verify the Maximum  
12 Allowable Operating Pressure ("MAOP") of the pipeline. If the records that  
13 establish MAOP for the pipeline and associated facilities are not traceable,  
14 verifiable, and complete ("TVC"), then the MAOP of the pipeline and  
15 facilities has to be reconfirmed. This is an ongoing process, so pipelines  
16 and facilities installed today have to have TVC records that establish  
17 MAOP of the pipelines and facilities. This changed, and continues to  
18 change, how GTS orders, receives, stores, and tracks materials. This has  
19 also changed how pressure tests are designed, executed, and tracked.  
20 This has changed how materials are tracked at time of installation and  
21 how that information is passed to our Geographic Information System  
22 ("GIS"). Finally, it has changed how we track all the records by the project  
23 engineers as a culmination of these processes.

1 Between 2016 and 2020, GTS completed review of the pipelines and  
2 MAOPV project results. All of the system's records were reviewed; if there  
3 was a location where MAOP and operating pressure conflicted, these  
4 locations were addressed. A further detailed review of the records was  
5 completed for the locations as required by Code and as discussed in more  
6 detail later in this testimony. In all, 143.8 miles (6.8% of system total)  
7 were reviewed and of that, 118.2 miles (5.6% of system total) met the  
8 conditions required to be validated for TVC records. Within the 118.2  
9 miles, 63.5 miles (53.7% of miles met) were found to have acceptable  
10 TVC records, and 54.7 miles (46.3% of miles met), 37 stations (27% of all  
11 stations), and 66 valve assemblies were found to have questionable  
12 records and are required to have MAOPR completed on them.

13

14 **Q. Please describe the impacts of the MAOPR on NorthWestern's GTS.**

15 **A.** MAOPR affects GTS because when the MAOPV process finds issues, the  
16 MAOP of the system in that area has to be reconfirmed. This can be done  
17 in several ways depending on the information or records that are not TVC.  
18 For example, if we are missing pipeline wall thickness, we can complete  
19 statistical sampling that proves the wall thickness of the pipe, which is  
20 fairly easy to accomplish by digging up the pipe in a number of locations.  
21 However, if the grade of the pipe is missing, which is harder to quantify,  
22 then the options are: (1) to complete in-situ testing that can be completed  
23 on a live pipeline, (2) removal of the segments in question for statistical

1 sampling, which involves taking the line out of service and removing  
2 sections of the line for sampling, or (3) completing a reroute of the line. As  
3 noted above, 63.5 miles were found to have acceptable TVC records and  
4 54.7 miles, 37 stations, and 66 valve assemblies need to have MAOPR  
5 completed on them because they are lacking TVC records to establish  
6 MAOP of the pipelines.

7  
8 Per the PHMSA rule, GTS has until 2028 to complete 50% of the  
9 reconfirmation work and until 2035 to complete 100% of the reconfirmation  
10 work. Over that 14 years, NorthWestern anticipates, using knowledge  
11 gained from PIM, that we will spend approximately \$220 million total (\$15  
12 million in capital per year and \$715,000 in expenses per year) to reconfirm  
13 MAOP on the GTS system.

14  
15 **Q. How do assessments outside HCAs impact GTS?**

16 **A.** Assessments outside an HCA have a big impact because the rule requires  
17 that any pipeline that meets the requirements for assessment will have to  
18 be assessed, which means that PIM assessment methods will be utilized  
19 on these segments of pipeline. Currently, GTS has 8.2 miles of HCA  
20 pipeline on the system; this code change will bring in an additional 84  
21 miles of pipelines that will have to be assessed with continual assessment  
22 going forward.

1 **Q. Are you aware of any future PHMSA-related obligations that would**  
2 **impact NorthWestern’s Gas Transmission and Storage Department?**

3 **Please explain.**

4 **A.** As can be seen in Chart 1, the regulatory world of PHMSA is ever  
5 evolving. Part 3 of the Mega-Rule was released in November 2021 with  
6 an effective date of May 2022. NorthWestern is in the process of  
7 evaluating the entire impact of that new rule.

8  
9 In the near future, Part 2 of the Mega-Rule should be released, which is  
10 the last part of the Mega-Rule to be issued, and it focuses entirely on  
11 transmission operators. Until that part is released, the entirety of the  
12 changes and magnitude of the impact on GTS is unknown.

13  
14 The automatic shut-off valve and rupture control mechanisms rule was  
15 released on April 8, 2022. This rule also focuses entirely on transmission  
16 operators. The rule will require operators to install automatic valves  
17 and/or rupture control mechanisms on new pipelines when certain  
18 requirements are met during construction and maintenance. NorthWestern  
19 is in process of reviewing the rule and evaluating the full impact.

20  
21 Additionally, there was a self-executing mandate within the reauthorization  
22 of PHMSA in 2020 that was executed in 2021, but realization of the

1 impacts to NorthWestern are not fully known at this time. This mandate  
2 affected both transmission and distribution operators.

3

4 **Q. What have been some of the major GTS PHMSA-related projects**  
5 **since NorthWestern's last natural gas general rate review?**

6 **A.** Some of the larger projects that have been completed since 2016 to  
7 comply with PHMSA regulations are:

- 8 • Bozeman East and West HCA Reroutes;
- 9 • Anaconda CCCS HCA Reroute;
- 10 • Storage Integrity Management, and
- 11 • Maximum Allowable Operating Pressure Verification.

12

13 **Q. Please explain each project noted in your last answer, including what**  
14 **work NorthWestern performed related to each and how much was**  
15 **spent.**

16 **A.** The Bozeman East and West HCA Reroutes were completed in 2016.  
17 These projects replaced 1930s and 1950s vintage transmission pipeline  
18 that ran through Bozeman and replaced it with modern pipeline. The  
19 replacement of these line segments was considered the initial assessment  
20 for the PIM program. The Code considers this as an initial assessment  
21 because new pipe and components were installed and all are subject to a  
22 pressure test that established MAOP. Because of the vintage of the  
23 original line and legacy construction practices, future evaluation and

1 assessment of the pipeline through this area would not have been easy  
2 and sections of the pipeline would have had to be replaced no matter  
3 what. The requirement to be able to assess this pipeline in the future and  
4 the number of unknown variables with a vintage material and installation  
5 practices prompted the decision to replace the pipeline. The replacement  
6 work allows for the pipeline to be assessed while remaining in-service with  
7 in-line inspection tools. Bozeman West investment was approximately  
8 \$2.8 million and Bozeman East investment was approximately \$0.6  
9 million.

10

11 Anaconda CCCS HCA Reroute was completed on a 1930s vintage  
12 pipeline. The reroute in this location was completed to move the pipeline  
13 outside the HCA requirements, thus eliminating the HCA. Elimination of  
14 the HCA at this location with a small reroute was selected because of the  
15 size of the HCA and the location of the pipeline. This line is located in a  
16 fairly remote area and the HCA is a very small section of the pipeline.  
17 Elimination of the HCA required installation of 900 feet of new pipeline,  
18 which made sense because most of the pipeline would have had to be  
19 updated to allow for future PIM assessments to occur for this HCA.  
20 Instead, this line will be maintained through normal operations and  
21 maintenance practices going forward. Anaconda CCCS investment was  
22 approximately \$250,000.

23

1 Storage Integrity Management requires the assessment of all the wells  
2 and reservoirs for natural gas storage. NorthWestern currently has three  
3 storage facilities and approximately 80 wells connected to those storage  
4 facilities. The Code requires that all the reservoirs and 40% of all wells  
5 have their initial assessments completed by March 13, 2024 and that the  
6 remaining 60% of wells be assessed by no later than March 13, 2027.  
7 NorthWestern is expected to meet these required timelines. The  
8 assessment process is very similar to what was experienced with the PIM  
9 program where there are significant changes to the vintage installations  
10 and varying construction practices that make it difficult to assess the wells  
11 and reservoirs. Following the completion of the initial assessment, all of  
12 the facilities must be reassessed on 10-year intervals. The investment to  
13 date from 2019 to 2021 is approximately \$1.7 million capital with \$0.4  
14 million of expense.

15  
16 Finally, as also discussed briefly above, the MAOPV was a project that ran  
17 from 2016 to 2020. The MAOPV project was developed based on  
18 PHMSA bulletins and actions following the San Bruno, California incident.  
19 PHMSA pushed operators through PHMSA-issued bulletins to assess the  
20 MAOP of their systems and verify that they were established with  
21 traceable, verifiable, and complete (TVC) records. NorthWestern  
22 complied with these bulletins. However, PHMSA issued an additional  
23 bulletin that described to more depth what TVC records should look like,

1 and PHMSA stated that operators would have to submit information on the  
2 following year's annual report.

3  
4 NorthWestern reached out to peer companies and organizations to  
5 determine what others were considering TVC records and how they were  
6 progressing through the process. It was determined through those  
7 conversations that a different approach was necessary. The change in  
8 approach was a full-scale review of the pipeline construction records from  
9 start to finish. The records needed to be searchable, and most of  
10 NorthWestern's records were flat file paper copies. All of the paper was  
11 scanned with meta-data added to assist with searching. Next, all of the  
12 scanned documents were reviewed from the earliest installation to the  
13 most current installation per pipeline. This was the most efficient method  
14 and it gave a whole review of the system. Additionally, the centerlines of  
15 the pipelines needed to be established precisely. Through the years of  
16 migration from flat maps to use of computer software, such as autocad to  
17 GIS systems, that data needed to be verified. NorthWestern completed a  
18 survey and GPS project for the entire pipeline system, which was then  
19 corrected in the GIS system.

20  
21 Following the contractor project to scan, review pipeline records, and  
22 report results, NorthWestern personnel were assigned to review the  
23 results and work through any data issues or gaps in the records utilized to

1 establish MAOP of the system. This provided the background and work  
2 necessary to ensure the ability to meet Part 1 of the Mega-Rule when  
3 published, which started NorthWestern on the path toward developing the  
4 Maximum Allowable Operating Pressure Reconfirmation (MAOPR) Plan.  
5 Without the MAOPV project, NorthWestern could not have met the  
6 timeline required to have the MAOPR Plan published in 2021.

7  
8 The MAOPV project investment, including development of the MAOPR  
9 Plan, was approximately \$3.6 million.

10

11 **Q. How does this level of costs compare to historical PHMSA-related**  
12 **investments?**

13 **A.** Generally, it is lower than historical costs for PIM-related projects, but new  
14 PHMSA regulations have increased and will continue to increase  
15 NorthWestern's investment for pipeline compliance. From 1970 until the  
16 issuance of the PIM in 2004, PHMSA-related requirements remained  
17 relatively constant. The tasks required in the original code (leak survey,  
18 line patrol, valve inspection, etc.) are completed as required on the  
19 prescriptive timelines that are within Code. There might be a slight  
20 deviation from one year to another because of an issue found that has to  
21 be addressed, but those costs have continued to remain fairly consistent  
22 with standard increases due to labor costs.

23

1 Since the PIM regulations took effect in 2004, NorthWestern has incurred  
2 over \$25 million in capital costs and \$4.5 million in expense costs. From  
3 2012 to 2015, NorthWestern spent approximately \$7.6 million in capital  
4 and around \$2.2 million in expense on PIM activities. The level of  
5 investment into PIM appears to be decreasing from the start of the  
6 program through today. Looking at 2012 through 2015, the capital and  
7 expense averaged about \$1.57 million and about \$0.73 million per year,  
8 respectively. Compared to 2016 through 2021 capital and expense,  
9 NorthWestern has invested around \$1.1 million and around \$0.41 million  
10 per year, respectively. Since the PIM program has been around for 17  
11 years, unless PHMSA issues new obligations related to it, NorthWestern  
12 anticipates that capital investment will continue to decline and expense will  
13 begin to increase.

14  
15 As discussed above, the costs for the storage integrity management  
16 program are new. The actual costs from 2019 to 2021 are noted above.  
17 The continuing program is estimated to require an additional \$3.6 million  
18 capital and \$0.9 million expense until completion of the initial  
19 assessments. This will make the total investment estimated to be \$5.3  
20 million capital and \$1.3 million expense. Similar to PIM, it is anticipated  
21 that after the initial assessments, the capital costs will decrease and the  
22 expense costs will increase because of reassessments.

23

1 The MAOPV work is also relatively new. While that work has now been  
2 completed, it, as noted above, informs the MAOPR Plan. The MAOPR  
3 Plan is anticipated to require \$15.75 million per year (\$15 million capital/  
4 \$750 thousand expense) over the next 14 years starting in 2022.

5  
6 **Q. Does NorthWestern conduct any analysis for projects prior to**  
7 **making the necessary investment?**

8 **A.** Yes. NorthWestern runs risk models to determine which PIM and  
9 integrity-based projects are needed. For example, casing evaluations are  
10 part of the UGSIM plan and are required by regulations. That plan  
11 undergoes regular review by a committee. The plan utilizes a risk model  
12 within the plan that is updated following assessments and re-evaluates  
13 where the program should focus.

14  
15 **Q. Does this conclude your testimony?**

16 **A.** Yes, it does.

### **VERIFICATION**

This Pre-filed Direct Testimony of Keith W. Meagor is true and accurate to the best of my knowledge, information, and belief.

/s/ Keith W. Meagor  
Keith W. Meagor
